

ABSTRACT OF THE DISCLOSURE

A non-reciprocal circuit element includes a plate-shaped magnetic member; a common electrode arranged on one side of
5 the plate-shaped magnetic member; first, second, and third center conductors which extend in three directions from the outer peripheral portion of the common electrode in such a manner as to surround the plate-shaped magnetic member, which are bent on the other side of the plate-shaped magnetic
10 member, and which intersect one another at predetermined angles on the other side; and a bias magnet arranged in such a manner as to oppose the plate-shaped magnetic member. The conductor width of at least portions of the first and second center conductors is less than 150 μm .
